I am a 3rd year PhD candidate studying computer science at Paris-Saclay University. My research interests include data science, graph algorithms, visualisation, AI research and bioinformatics.

Education

PhD Candidate 2023–present
Paris-Saclay University
Thesis: *A graph-based framework for scientific workflows: modelling, abstraction, and visualisation for reuse*
Supervisors: Sarah Cohen-Boulakia (Paris-Saclay University) and Frédéric Lemoine (Pasteur Institute)

Modern research has become increasingly data-intensive, with fields such as bioinformatics generating vast amounts of raw data. Turning this data into meaningful results relies on large, complex analysis pipelines, making effective data management and integration central to scientific discovery. At the same time, growing awareness of the reproducibility crisis has highlighted the need to build these pipelines in a more reproducible way, since science advances by reproducing and reusing prior work.

Scientific workflows, and in particular code-based systems such as Nextflow and Snakemake, have emerged as a solution to provide better reproducibility, offering software encapsulation, scalability and flexibility. Reusing workflows lets researchers build on existing components and supports **collaborative and interdisciplinary research**. However, workflows are often complex and defined in heterogeneous ways, which makes them hard to share, understand and discover, ultimately limiting their reuse.

To provide an element of solution to this problem, this PhD work proposes a framework that: (i) models heterogeneous workflows as a **homogeneous graph structure**, bridging the implicit structures of code-based implementations and explicit workflow representations; (ii) formalises graph-based methods to automatically **generate simplified representations of workflows at multiple levels of granularity**, reducing their perceived complexity; and (iii) applies **information visualisation** principles to present these structures with a **consistent visual metaphor**, enabling interactive exploration across simplification levels and linking visuals directly to the source code. These solutions have been implemented in multiple open-source tools, making them directly available to the research community.

Together, these contributions, at the intersection of **data management and integration**, **visualisation** and **open-source software development**, aim to support the overarching goal of enhancing workflow transparency and understandability, in order to facilitate workflow reuse.

Master's Degree in Bioinformatics, Computational Biology Track, with First Class Honours 2021–2023
Digicosme scholarship for excellence
Paris-Saclay University

- **Advanced Databases:** query optimisation and rewriting, indexing structures, query plans, schema optimisation and data storage strategies.
- **Massive Data Project:** designed and built a web application to query and enrich a large database. Covered client/server architecture, database design for data volume, security awareness and user needs.
- **Omics Data Analysis and Integrative Biology:** statistical modelling and integration of heterogeneous high-throughput data.
- **Models for Machine Learning:** supervised regression and classification, cross-validation, model selection, random forests, LASSO, SVM.
- **Advanced Machine Learning:** semi-supervised learning, ensemble learning, out-of-distribution learning, transfer learning. Included a group project reproducing a recently published paper and writing a critical report.

Double Bachelor's Degree in Mathematics and Computer Science 2018–2021
Université Paris-Saclay

Talks

A graph-based framework for scientific workflows: modelling, abstraction, and visualisation for reuse (Planned) November 2026
EMBL Scientific Workflows Club

Facilitating reuse of Nextflow workflows with structure reconstruction and metro-map visualisation with BioFlow-Insight and MetroFlow September 2026
FAIR metadata for bioinformatics software workshop at *ECCB 2026*

Workflow abstractions to improve understandability and reusability of workflow code April 2026
Visiting the *VIDA Center* (New York University)

MetroFlow: Generating Interactive Metro-Maps from Workflow Code
ShareFAIR annual meeting (Pasteur Institute) December 2025
Nextflow Summit · Talk: https://summit.nextflow.io/2025/virtual/agenda/metroflow-generating-interactive-metro-maps-from-workflow-code/ October 2025

Facilitating the reuse of scientific workflows with structure abstraction June 2025
Visiting the *Software Sustainability Institute* (University of Manchester)

BioFlow-Insight: facilitating reuse of Nextflow workflows with structure reconstruction and visualisation
ShareFAIR annual meeting (Pasteur Institute) November 2024
Team seminar (Paris-Saclay University, LISN) January 2025
